

Assignment 2: Bash Shell Basics

Name: Raj Mishra

Date: 28-05-2023

Reg. No.: 20BCN7155

Campus: VIT-AP

Task 1: File and Directory Manipulation

1. Create a directory called "my_directory".

```
└─$ mkdir my_directory
```

This command creates a new directory named "my_directory" in the current working directory.

2. Navigate into the "my_directory".

```
└─$ cd my_directory
```

This command changes the current working directory to "my_directory".

3. Create an empty file called "my_file.txt".

```
└─$ touch my_file.txt
```

The touch command is used to create an empty file. In this case, it creates a file named "my_file.txt" in the current directory.

4. List all the files and directories in the current directory.

```
└─$ ls
my_file.txt
```

The ls command lists the files and directories in the current directory.

5. Rename "my_file.txt" to "new_file.txt".

```
└─$ mv my_file.txt new_file.txt
```

```
└─$ ls
new_file.txt
```

The mv command is used to move or rename files. In this case, it renames the file "my_file.txt" to "new_file.txt".

6. Display the content of "new_file.txt" using a pager tool of your choice

```
└─$ less new_file.txt
```

```
hello world
new_file.txt (END)
```

The less command is a pager tool that allows you to view the content of a file page by page. In this case, it displays the content of the file "new_file.txt". You can scroll through the content using the arrow keys and press "q" to exit.

7. Append the text "Hello, World!" to "new_file.txt".

```
$ echo "Hello,World! " >> new_file.txt
```

The echo command is used to print text. The >> operator is used to append the output to a file. In this case, it appends the text "Hello, World!" to the file "new_file.txt"

8. Create a new directory called "backup" within "my_directory".

```
$ mkdir backup
```

This command creates a new directory named "backup" within the "my_directory" directory.

9. Move "new_file.txt" to the "backup" directory.

```
$ mv new_file.txt backup/
```

This command moves the file "new_file.txt" to the "backup" directory.

10. Verify that "new_file.txt" is now located in the "backup" directory.

```
$ ls backup
new_file.txt
```

This command lists the contents of the "backup" directory to verify that "new_file.txt" is present there.

11. Delete the "backup" directory and all its contents.

```
$ rm -r backup
```

```
$ ls
```

The rm command is used to remove files and directories. The -r option is used to recursively remove directories and their contents. In this case, it deletes the "backup" directory and all its contents.

Task 2: Permissions and Scripting

1. Create a new file called "my_script.sh".

```
$ touch my_script.sh
```

This command creates a new file named "my_script.sh" in the current directory.

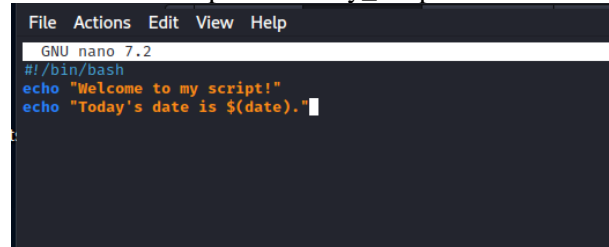

2. Edit "my_script.sh" using a text editor of your choice and add the following lines:
bash

```
#!/bin/bash
echo "Welcome to my script!"
echo "Today's date is $(date)."
```

Save and exit the file.

```
$ nano my_script.sh
```

This command opens the "my_script.sh" file in the nano text editor, allowing you to edit the file

A screenshot of the nano text editor interface. The top menu bar shows 'File', 'Actions', 'Edit', 'View', and 'Help'. Below the menu bar, it says 'GNU nano 7.2'. The main editing area contains the following text: '#!/bin/bash', 'echo "Welcome to my script!"', and 'echo "Today's date is \$(date)."' followed by a cursor. The background is dark, and the text is light-colored.

These lines are added to the "my_script.sh" file. The first line specifies the interpreter (#!/bin/bash), and the subsequent lines use the echo command to print text.

3. Make "my_script.sh" executable

```
$ chmod +x my_script.sh
```

The chmod command is used to change the permissions of a file. The +x option makes the file executable, allowing it to be run as a script.

4. Run "my_script.sh" and verify that the output matches the expected result.

This command executes the "my_script.sh" file, and the output should display the text specified in the script, including the current date and time

Task 3: Command Execution and Pipelines

1. List all the processes running on your system using the "ps" command.

```

$ ps aux
USER      PID %CPU %MEM    VSZ   RSS TTY      STAT START   TIME COMMAND
root         1  0.0  0.3 168024 12456 ?        Ss   16:28   0:00 /sbin/init splash

```

The `ps` command is used to display information about active processes. The `aux` options provide a detailed list of all processes running on the system.

2. Use the "`grep`" command to filter the processes list and display only the processes with "`bash`" in their name.

```

$ ps aux | grep bash
sankypa+  24974  0.0  0.0  6332  2084 pts/0    S+   17:59   0:00 grep --color=auto bash

```

The `grep` command is used to search for specific patterns in the input. In this case, it filters the output of the `ps aux` command to display only the processes that contain the word "`bash`".

3. Use the "`wc`" command to count the number of lines in the filtered output.

```

$ ps aux | grep bash | wc -l
1

```

The `wc` command is used to count the number of lines, words, and characters in the input. The `-l` option tells `wc` to count only the lines. In this case, it counts the number of lines in the filtered output of the previous command, giving the total number of processes with "`bash`" in their name.
